Amazon Bedrock AgentCore > Memory

Amazon Bedrock AgentCore Memory may securely transmit data across Regions within your geography for processing.
For more information, access Amazon Bedrock AgentCore Memory Documentation

Memory info

How it works

Create a memory resource

Create Memory to help agents learn over time. Memory stores short-term events and long-term memory records (if configured), allowing agents to remember conversations and provide personalized responses.

Create memory

Integrate it within an agent to invoke

Integrate the memory within your agent code using the memory ARN to retain context, knowledge, and user preferences across sessions.

Assess performance using observability

Monitor metrics, sessions, traces, and spans to see how your memory resource is performing.

Learn more about enabling observability for a specific resource or at the account level.

View observability dashboard
